

About Drip system

Water is one of the precious natural resources for Agriculture and unfortunately ground water table is fast depleting. Hence, for future agriculture needs, water is to be used efficiently to improve the yield and income level of the farmer.

Today many of the farmers are switching over to Drip Irrigation so that crop cultivation is carried with efficient use of scarce water.

Drip Irrigation is slow and even application of water and nutrients directly in the root zone of the soil through low pressure pipe network comprising of mains, sub mains , laterals and emitting devices.
